FINALLY UNDERSTANDING THE GAME

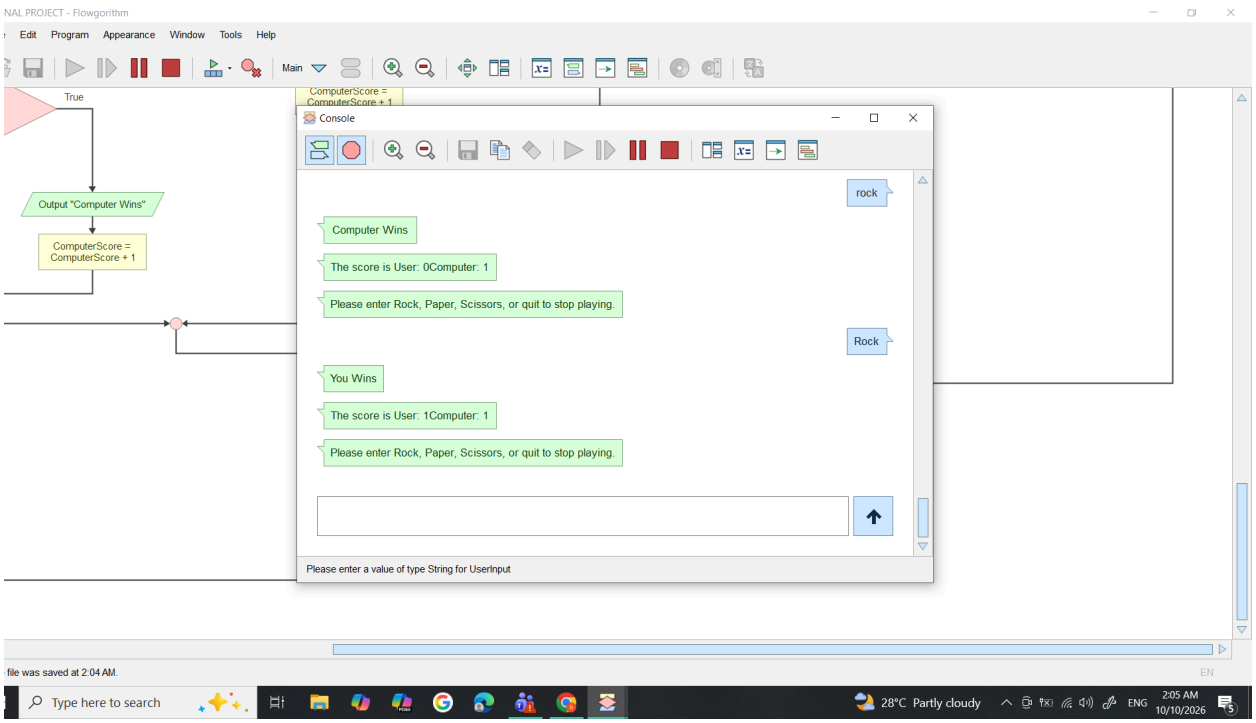

IT’S GOING PRETTY GOOD

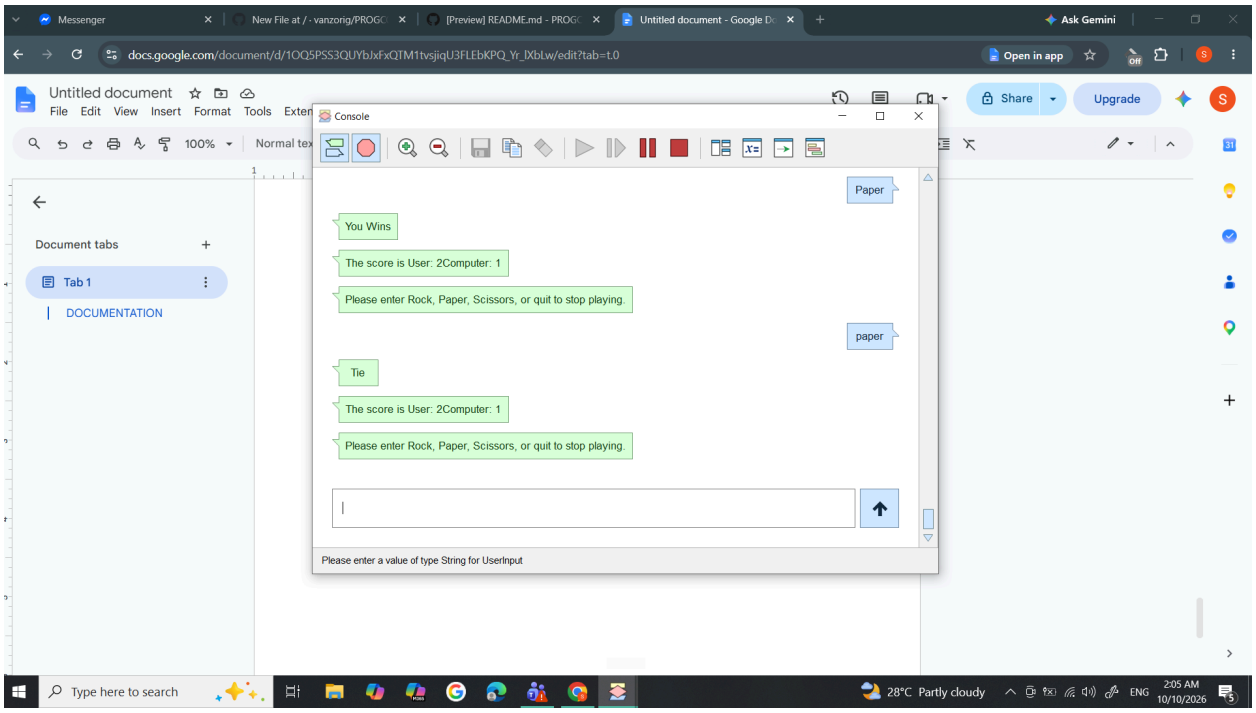

GAME IS WORKING!

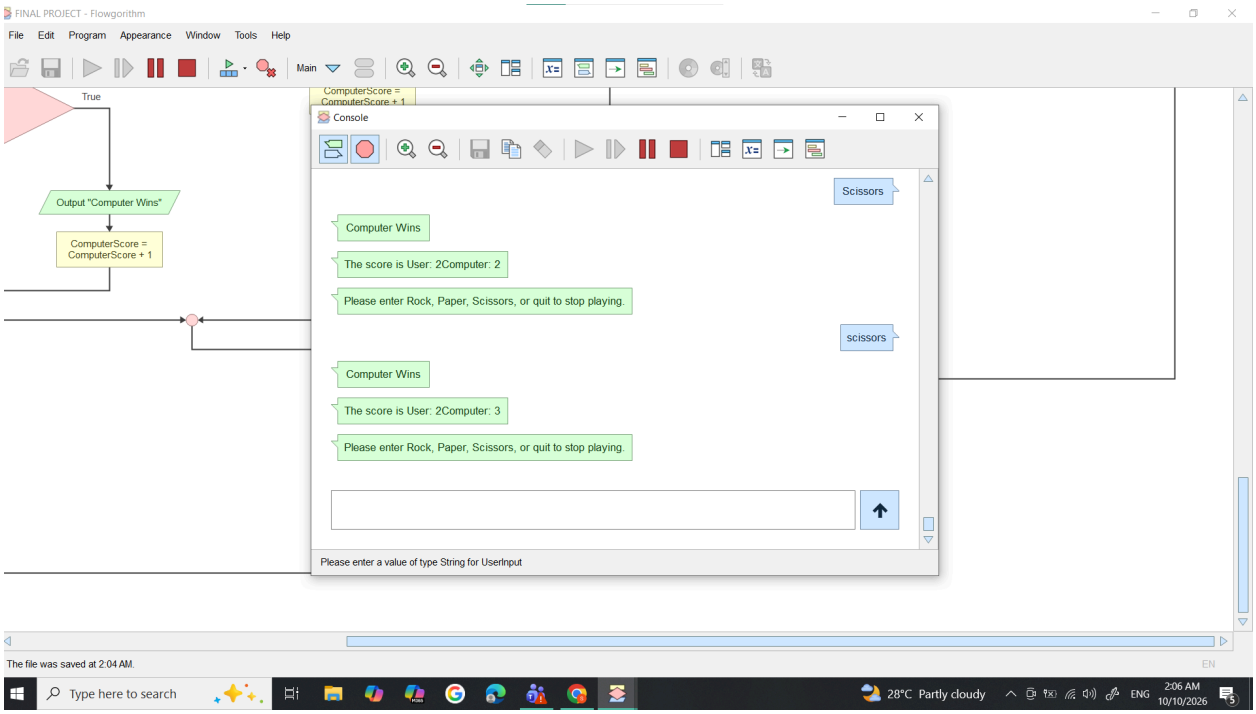

Rock

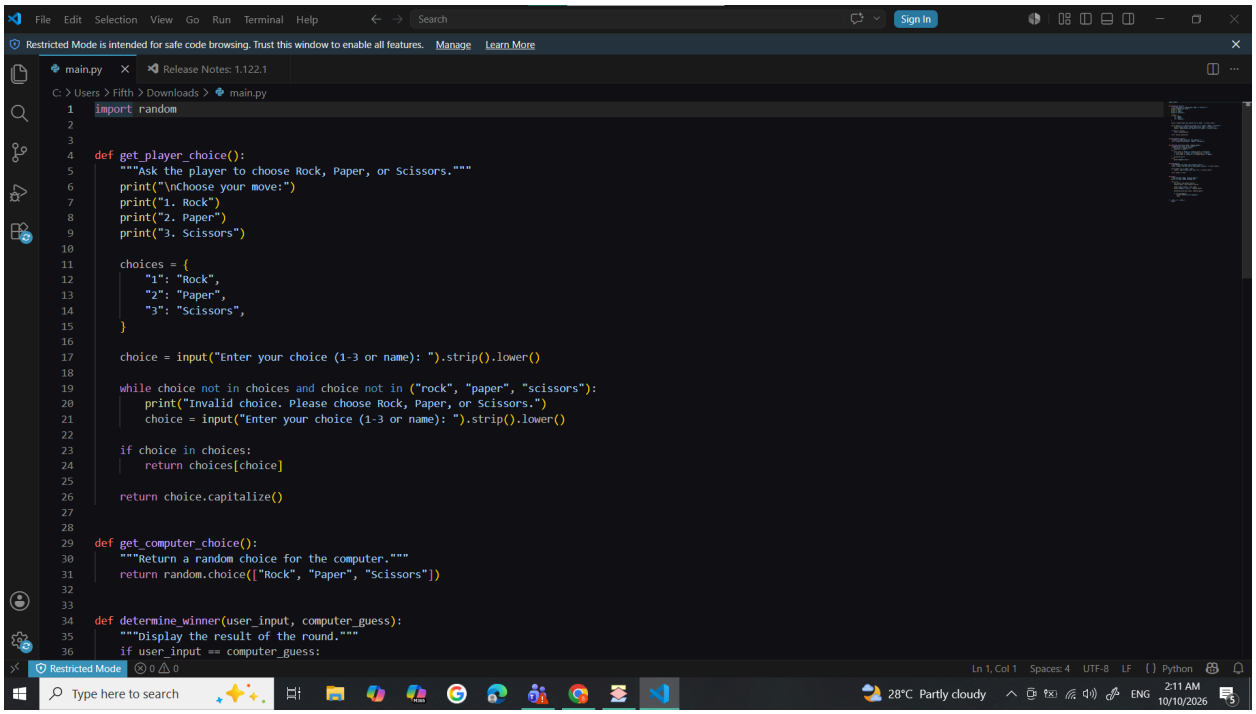

Paper

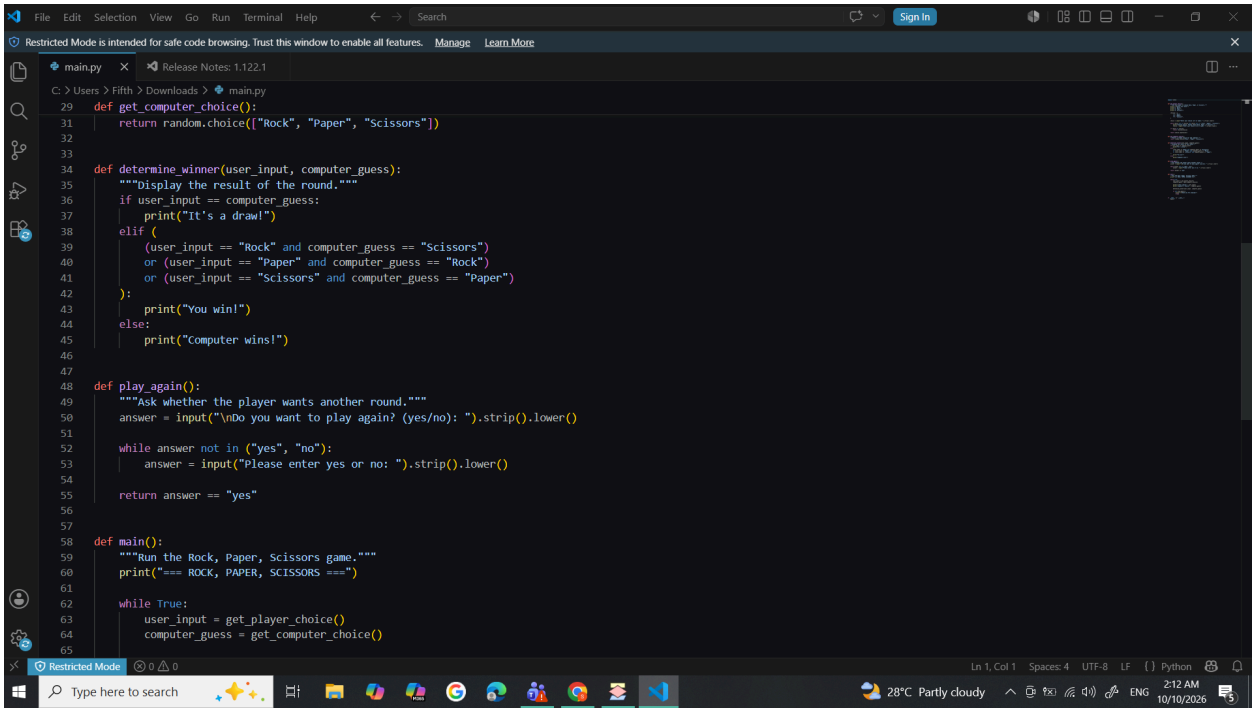

Scissors

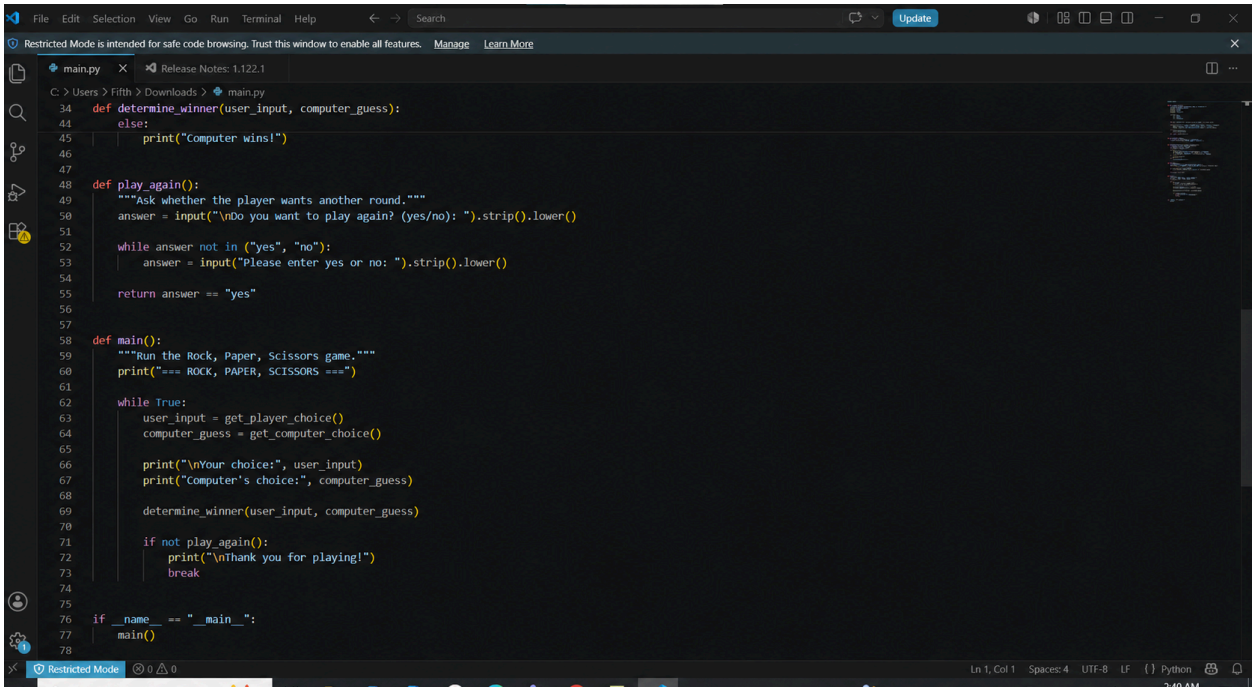

AFTER THAT I CODED THE PROGRAM “PYTHON WITH MY PARTNER”

IT'S A BIT TROUBLING BECAUSE AFTER 20-25MINS OF ERROR AND DEBUGGING IT'S NOW FIXED!

Reflection on Pair Programming Activity

Our Pair Programming Activity in PROGCON IT261 was a challenging but meaningful experience for me. At first, I thought creating a simple Rock, Paper, Scissors game would be easy because the rules were familiar to me. However, when I started turning the idea into an actual program using Flowgorithm and Python, I realized that programming is not just about knowing what you want to create. It is also about understanding the logic behind every decision and making sure that everything works correctly.

Throughout the activity, I encountered several mistakes and difficulties. There were times when my conditions were incorrect, some of my statements did not work as expected, and I had to review my logic repeatedly. Even a simple game became challenging when I needed to consider different outcomes, such as winning, losing, and drawing. I realized that one small mistake in a condition could affect the entire program. Instead of getting everything right immediately, I had to learn through trial and error, which taught me to be more patient and careful when programming.

One of the most helpful parts of this activity was working with my partner, Charleson. He helped me with the Python code, especially when I needed assistance translating the program's logic into working code. His help made the process easier to understand, and it reminded me that programming does not always have to be a solo activity. Sometimes, another person's perspective can help you see mistakes that you might have overlooked. I appreciated his willingness to help because it allowed me to learn from the experience rather than simply struggle with the problems on my own.

Aside from programming, I also learned the importance of communication and teamwork. Pair programming requires both members to cooperate, share ideas, and support each other when problems arise. It is not only about finishing the task but also about understanding how the solution works. Through this experience, I became more aware of the importance of asking questions, checking my work, and being open to suggestions from my partner.

The activity also taught me that making mistakes is a normal part of learning how to code. Before, encountering errors could make me feel frustrated because I wanted the program to work immediately. However, I realized that errors are opportunities to improve my understanding. Every time I corrected a condition or fixed a problem, I gained more knowledge about programming logic. I learned that becoming a better programmer requires patience, consistency, and the willingness to keep trying even when things do not work on the first attempt.

This activity was more than just creating a Rock, Paper, Scissors game. It helped me understand the value of collaboration, problem-solving, and perseverance. I am grateful to Charleson for helping me with the Python code and for being part of this learning experience. Although we encountered difficulties along the way, we were able to work through them and complete the activity. This experience reminded me that success in programming is not about avoiding mistakes but about learning how to correct them. Moving forward, I want to become more confident in writing Python code, improve my understanding of functions and conditional statements, and become more independent in solving programming problems while continuing to appreciate the value of teamwork.

Lastly, I would also like to sincerely apologize for submitting our activity late. I had work responsibilities that I needed to attend to, while my partner, Charleson, was also sick during this time. Because of these circumstances, we experienced some difficulties managing our time and completing the activity within the given deadline. However, I understand that these reasons do not remove our responsibility to submit our work on time. I sincerely apologize to our instructor for the delay and for any inconvenience it may have caused. Despite these challenges, we still did our best to complete the activity and learn from the experience. I hope for your kind understanding and consideration. Moving forward, I will do my best to manage my time more effectively, balance my responsibilities, and communicate earlier whenever unexpected circumstances affect our work. Thank you for your patience and understanding.
